	National University of Sciences and Technology College of Electrical and Mechanical Engineering Department of Computer & Software Engineering **Assignment-2 [CLO-3 (C4)]**	

Max Marks: 10 **Due Date: 10th April, 2026**

Note:

No submission is accepted after due date.
Submit solution on LMS.

Case Study Analysis: Real-World Cloud Security Breach

Select a real-world cloud security breach (e.g., Capital One, Dropbox, Amazon Web Services). Analyze the breach in-depth by addressing the following:

1. **Cause Analysis**

   Identify and critically evaluate the root causes of the breach. What vulnerabilities or lapses in cloud security led to the exposure or compromise of data?

2. **Preventive Measures**

   Based on your analysis, suggest specific cloud security measures that could have been implemented to prevent or mitigate the breach. How would better design, security controls, or policies have reduced the likelihood of this breach occurring?

3. **Lessons Learned and Future Improvements**

   What key lessons can be learned from the breach, both for the organization involved and for others utilizing cloud environments? How can organizations enhance their cloud security practices moving forward to avoid similar incidents?
