EPILEPSY DETECTION SYSTEM USING WEARABLE SENSORS

ABSTRACT

This project features a low-cost, non-invasive wearable sleeve for real-time epileptic seizure detection. Integrating sEMG, PPG, and IMU sensors with an ESP32-C3, the system utilizes a machine learning pipeline and CNN classifier to identify seizure events. A Flutter-based mobile app provides real-time visualization and event logging via PostgreSQL. The system offers a sustainable, clinically meaningful monitoring solution that operates reliably in real-world environments without requiring centralized infrastructure.

FIGURE

OBJECTIVES

- Develop a non-invasive, low-cost hardware solution
- Implement a real-time signal processing pipeline
- Create a lightweight seizure classification model
- Establish a cloud-based communication and monitoring ecosystem
